Nearest neighborhood-based comparisons across biological conditions in single cell data

2 February 2018 Tyler J Burns, PhD AG Mei at DRFZ

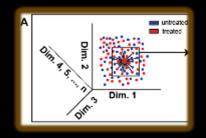

## Outline

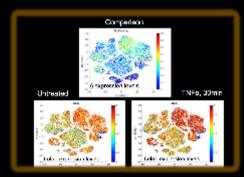

Building per-cell k-nearest neighborhoods in high-D space

Making single-cell comparisons across t-SNE maps

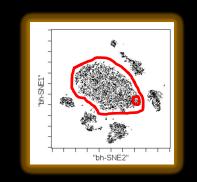

Establishing an evaluation metric for data quality

Evaluating the fidelity of lower-dimensional embeddings

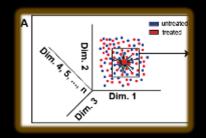

## Outline

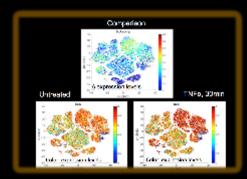

Building per-cell k-nearest neighborhoods in high-D space

Making single-cell comparisons across t-SNE maps

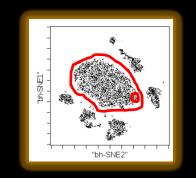

Establishing an evaluation metric for data quality

Evaluating the fidelity of lower-dimensional embeddings

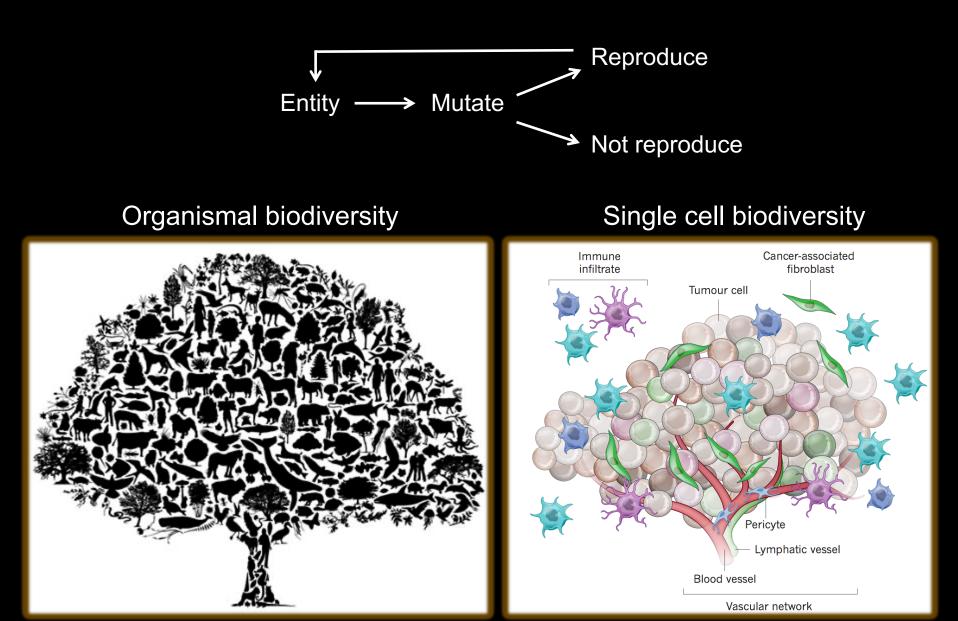

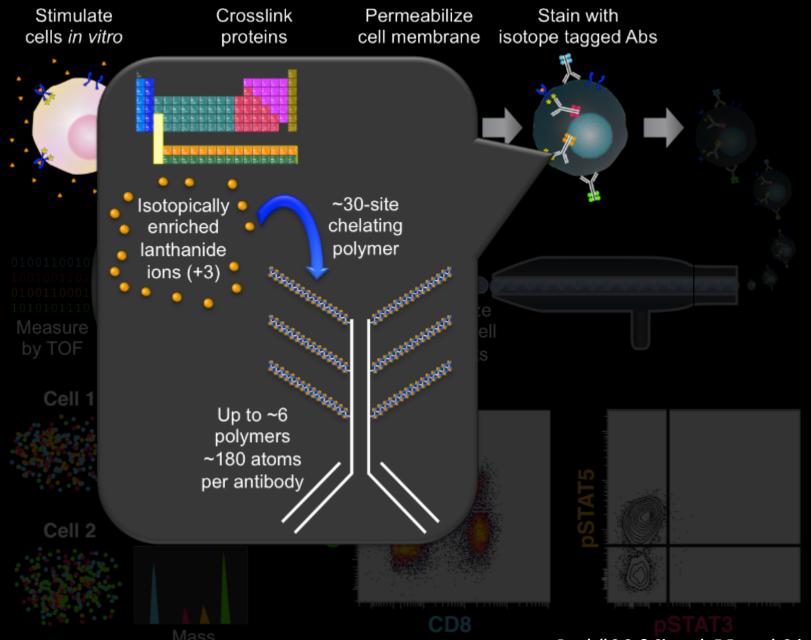

# Biodiversity exists between organisms and between cells

Slide adapted from Sean Bendall

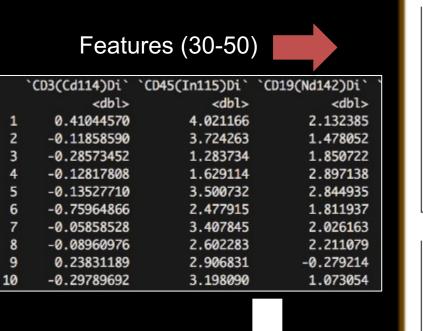

#### Mass cytometry is a powerful technique for single-cell analysis

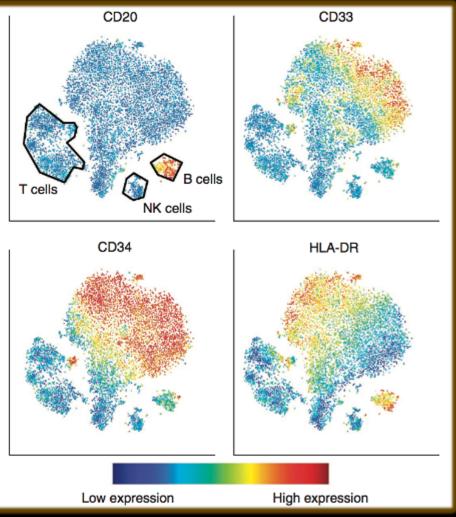

Bendall S.C. & Simonds E.F., et al. Science (2011)

### Dimension reduction algorithms (eg. t-SNE) map highdimensional data to two dimensions

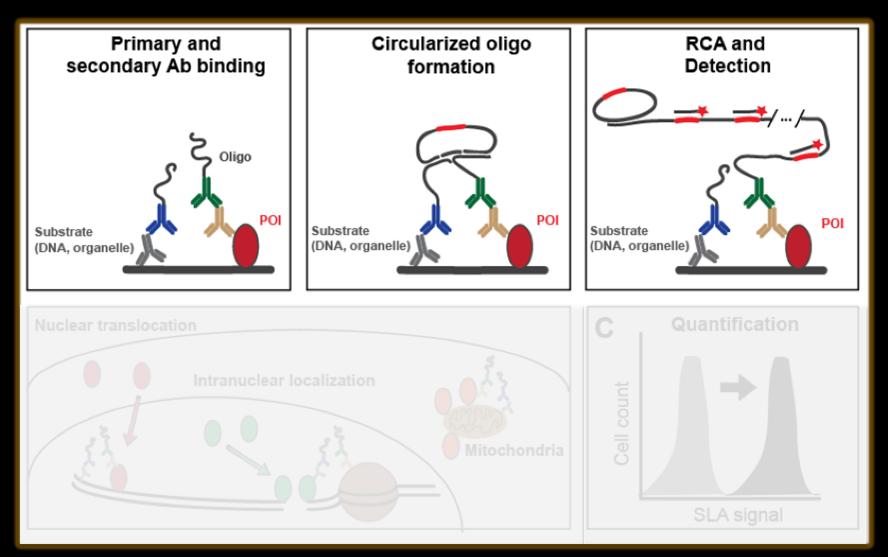

challenging. Here we present viSNE, a tool that allows one to map high-dimensional cytometry data onto two dimensions, yet conserve the high-dimensional structure of the data. viSNE plots individual cells in a visual similar to a scatter plot, while

Cells  $(10^{4} - 10^{6})$ 

## Subcellular Localization Assay brings visualspatial information to flow and mass cytometry

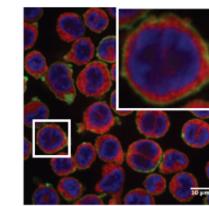

#### Burns et al, Cytometry 2017

# Nuclear import of NF-kB can be visualized with flow cytometry

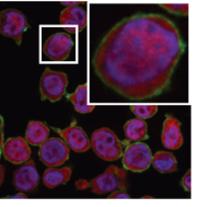

#### Confocal microscopy

#### THP-1 cells Hoechst/NFkB/CD45

Α

Untreated (UT)

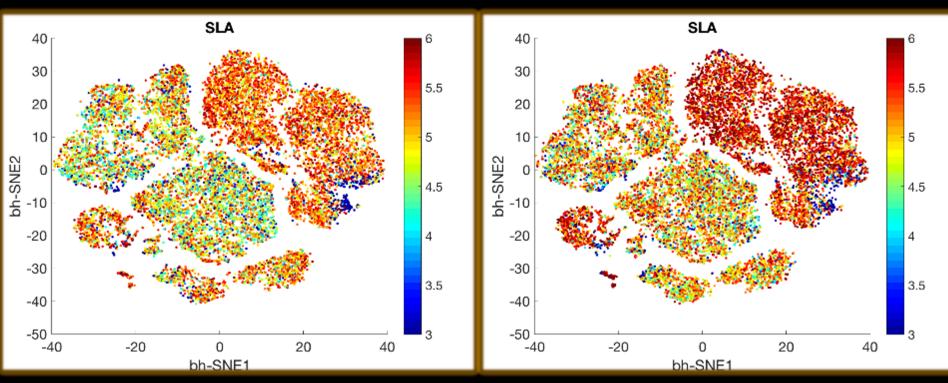

TNFα

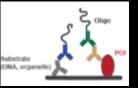

# SLA applied to mass cytometry requires comparison of colored t-SNE maps

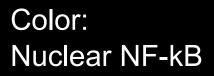

#### Untreated

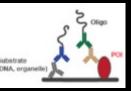

TNFα, 30min

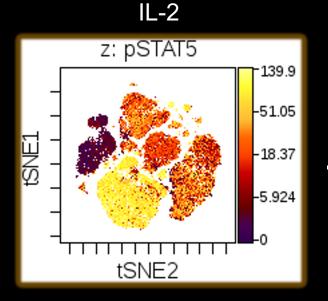

Color: Nuclear NF-kB

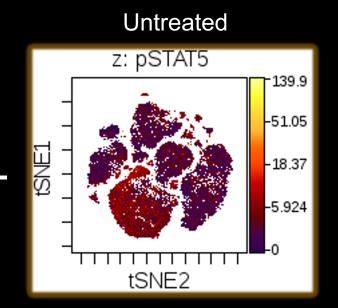

### One solution: Pixel color value subtraction of t-SNE maps

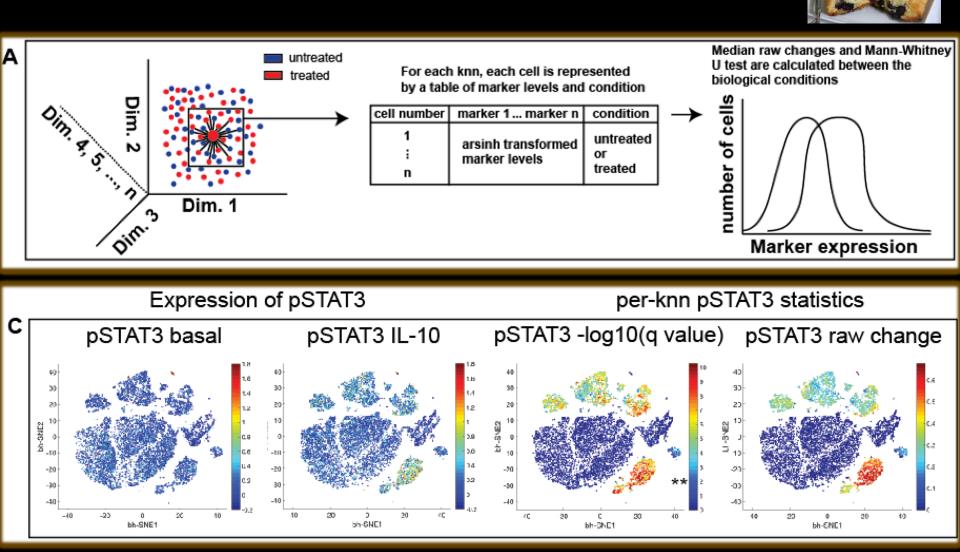

Each pixel = (red 1-255, green 1-255, blue 1-255) subtract image 2 from image 1 pixel by pixel

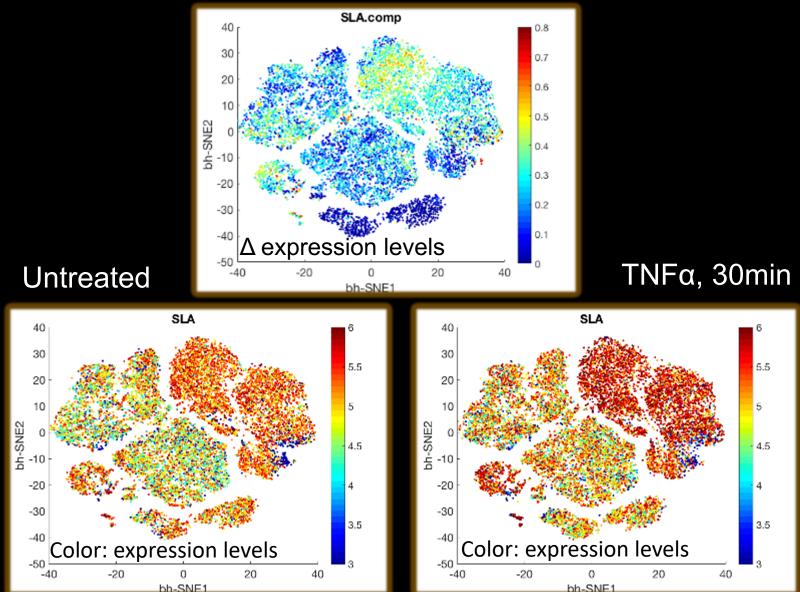

Yellow = significant increase(yellow – black) Green = moderate increase(yellow – red) Red = small increase(red – black) Black = no difference (any – any)

## My solution: Smooth Comparisons Over nearest Neighbors (SCONE)

### SCONE visualizes nuclear import of NF-kB

## The idea of nearest neighbor analysis

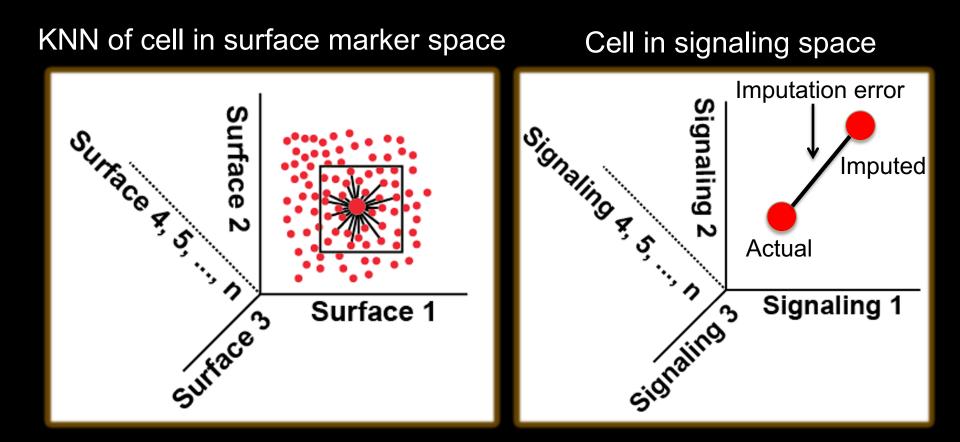

### Ibn Al-Haytham (Alhazen), 965-1040

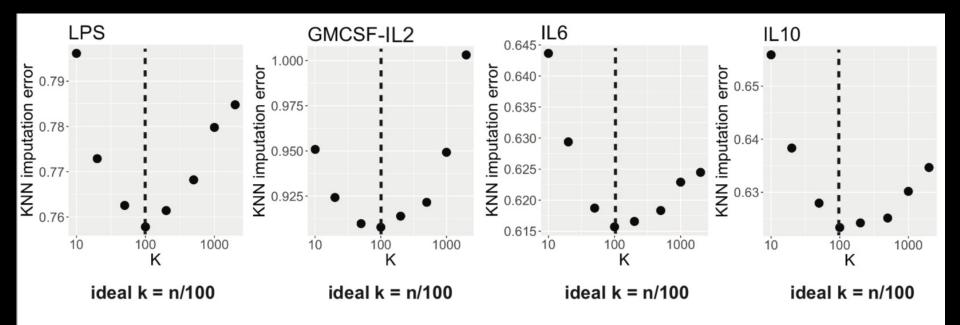

- X-Shift, Samusik et al, *Nat. Meth* 2016 (KNN density estimation)
- Phenograph, Levine et al, Cell 2015 (KNN graph clustering)
- One-SENSE, Chang et al, J Immuno 2015 (validation of 1D t-SNE)
- KNN smoothing, Wagnar et al, *BiorXiv* 2017

Hence, when sight perceives some visible object, the **faculty of discrimination** immediately **seeks its counterpart among the forms** persisting in the imagination, and **when it finds** some form in the imagination that is like the form of that visible object, **it will recognize** that visible object and will perceive what kind of object it is. (p. 519)

### Finding k objectively: optimize imputation of functional markers

## Global imputation error across different values of k is convex

Dataset: Fragiadakis *et al, Anesthesiology* (2015) Donor: healthy human Cell type: whole blood Cell number (n): 10,000

n = number of cells in dataset

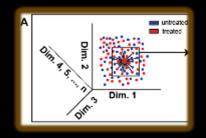

## Outline

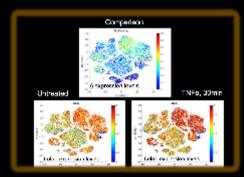

Building per-cell k-nearest neighborhoods in high-D space

Making single-cell comparisons across t-SNE maps

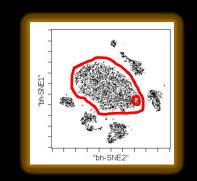

Establishing an evaluation metric for data quality

Evaluating the fidelity of lower-dimensional embeddings

### Use case: continuous B cell developmental trajectory

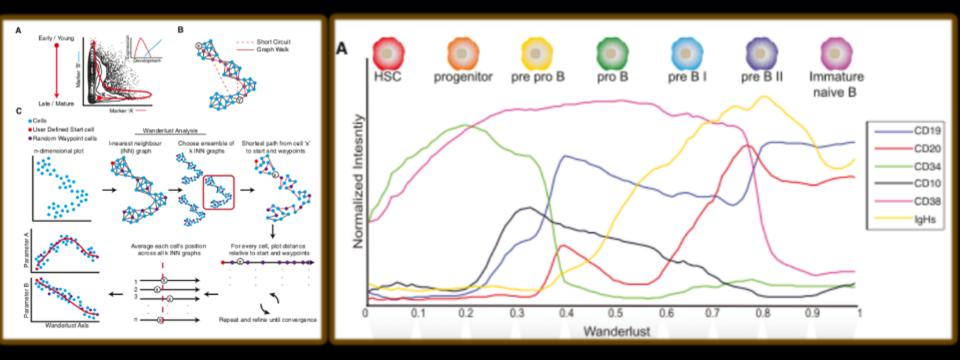

- Cells: B cell precursors manually gated (by expert Kara Davis, DO) from healthy human bone marrow
- Stimulation conditions: untreated, IL-7
- Goals:
  - Visualize an IL-7 responsive subset along the B cell trajectory

### Wanderlust finds a developmental trajectory in single cell data

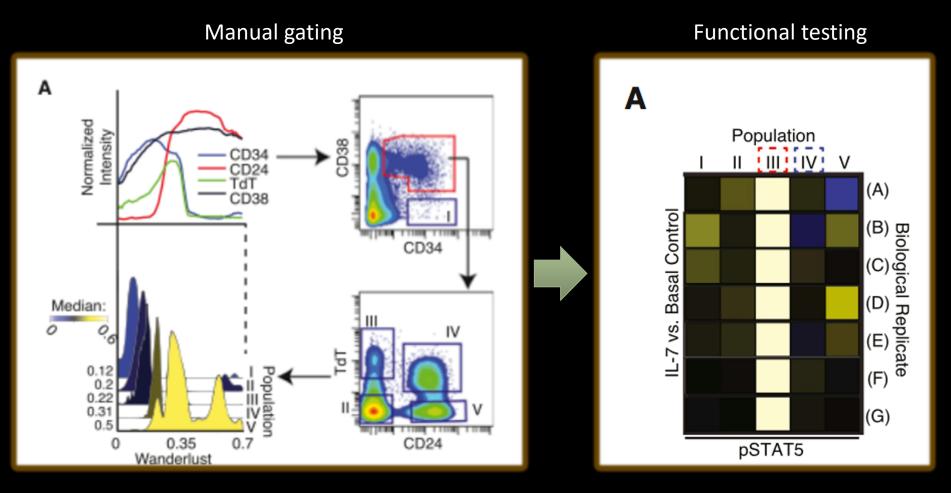

#### Cell alignment by time

#### **Reveals developmental trajectories**

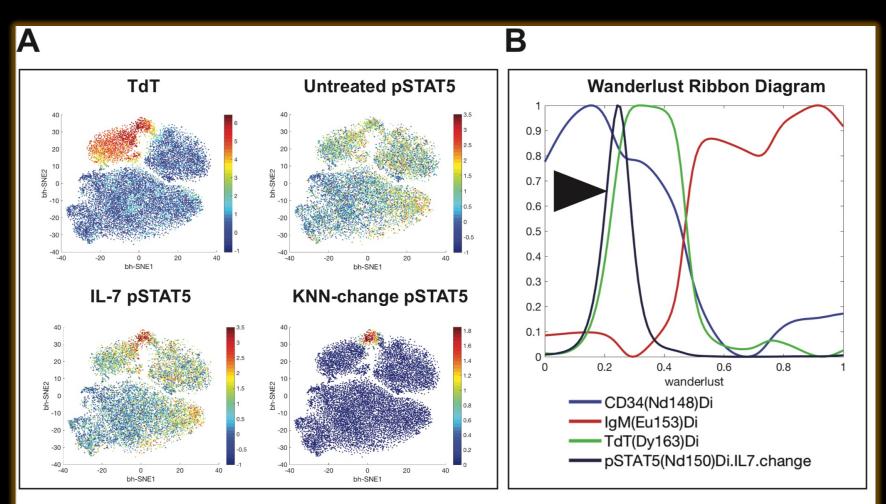

Bendall, Davis, *Cell* 2014

# Wanderlust discovered an IL7-pSTAT5 responsive subset

### IL7-pSTAT5 responsive subset resides between two "coordination points"

Dataset: Bendall, Davis, Amir *et al, Cell* (2014) Donors: healthy human Cells: B cell precursors gated from bone marrow Cell number: 20,000

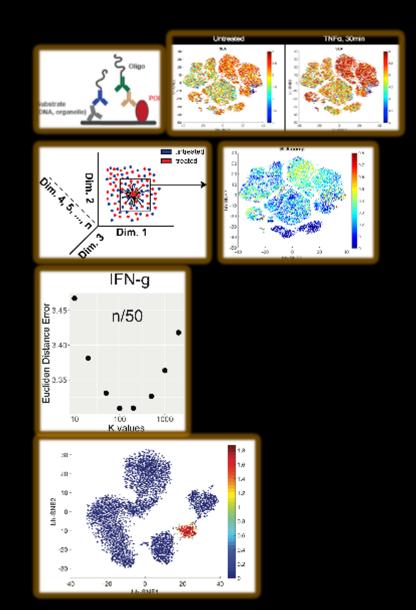

## Summary 1

SLA method revealed t-SNE comparison problem

t-SNE comparison problem solved with K-nearest neighbors

K is selected by minimizing the KNN-imputation error for functional markers

IL-7 responsive population and density estimation shown at single cell level

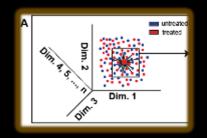

## Outline

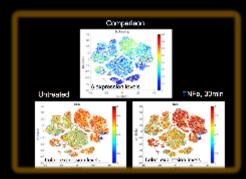

Building per-cell k-nearest neighborhoods in high-D space

Making single-cell comparisons across t-SNE maps

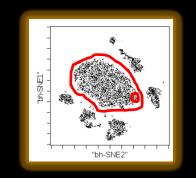

Establishing an evaluation metric for data quality

Evaluating the fidelity of lower-dimensional embeddings

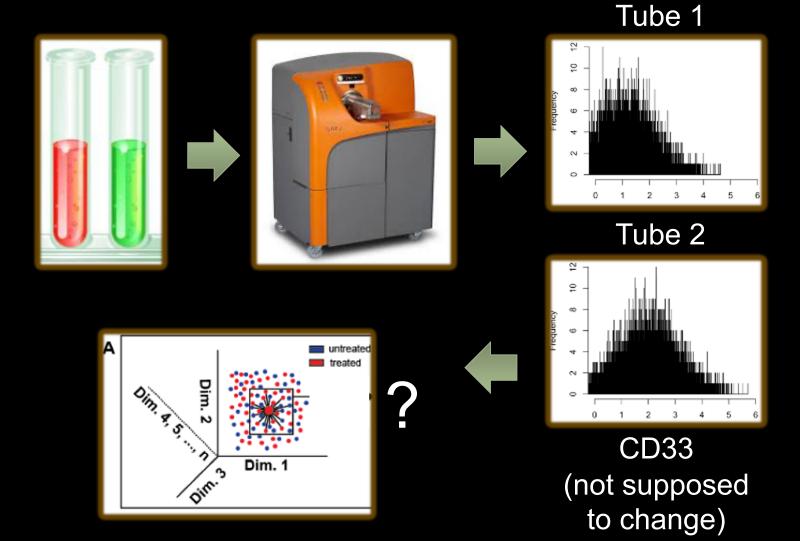

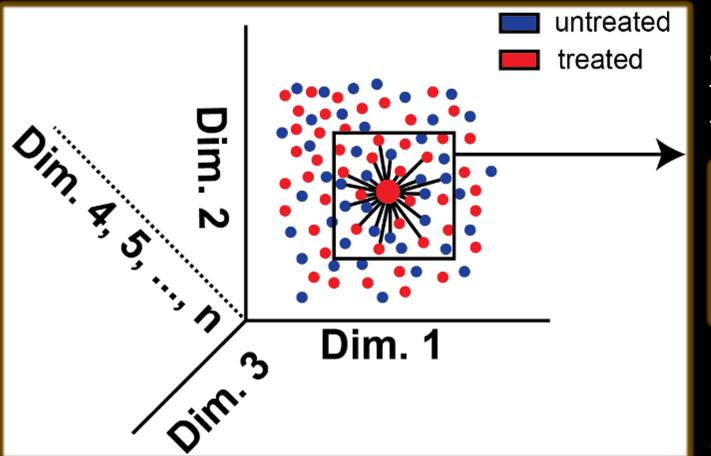

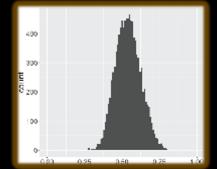

# Does population-defining marker space "shift" due to technical artifact between tubes?

# How to test for marker "shift" due to technical artifact? Use KNN.

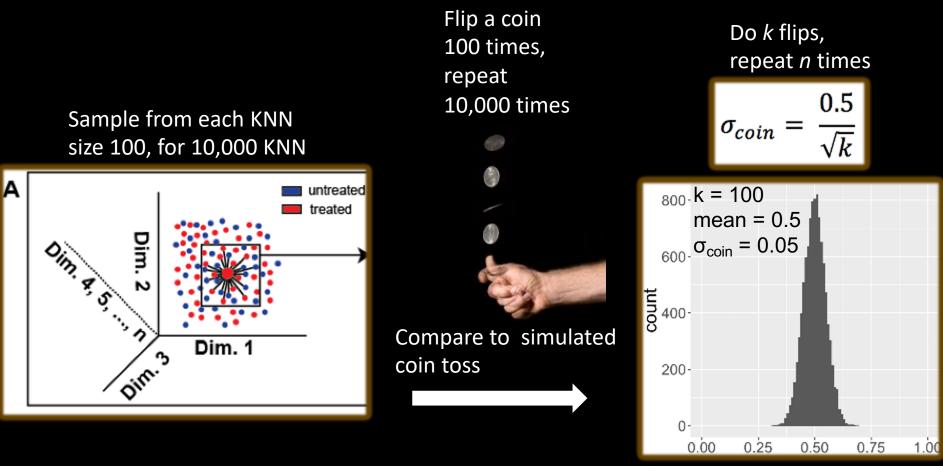

For each KNN calculate the fraction belonging to "red" condition

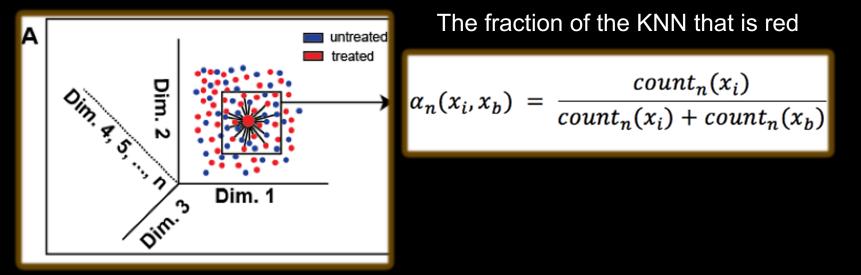

But what do we benchmark the SD to?

# A coin toss distribution represents "perfect" manifold overlap

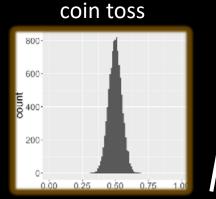

Fraction heads

# Evaluation metric: manifold overlap score to quantify global tube-to-tube technical variation

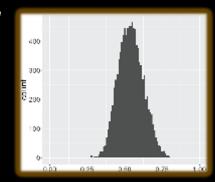

"Fraction red" for all KNN in the dataset, one for each cell

$$\alpha(x_{i}, x_{b}) = \{\alpha_{1}(x_{i}, x_{b}), \alpha_{2}(x_{i}, x_{b}), \alpha_{3}(x_{i}, x_{b}), \alpha_{4}(x_{i}, x_{b}), \dots, \alpha_{n}(x_{i}, x_{b})\}$$

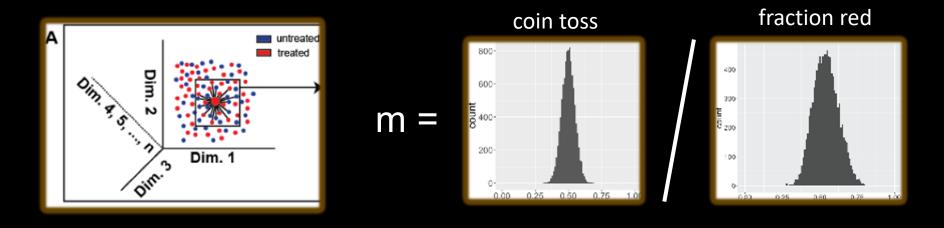

#### fraction red

SD of fair coin toss distribution, divided by SD of "fraction red" distribution

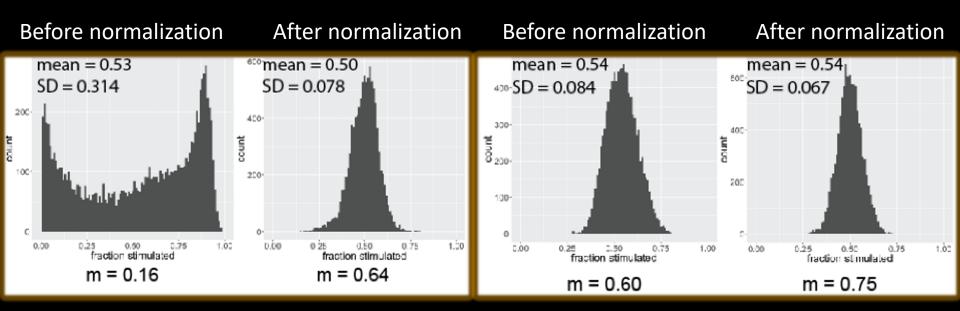

$$m = \frac{\sigma_{coin}}{\sigma(\alpha(x_i, x_b))}$$

### Normalization can improve manifold overlap score

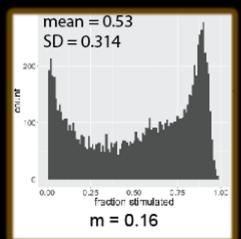

#### Bodenmiller, Zunder *et al, Nat Biotech* 2012 Untreated vs GM-CSF

Bendall, Davis *et al*, *Cell* 2014 Untreated vs IL-7

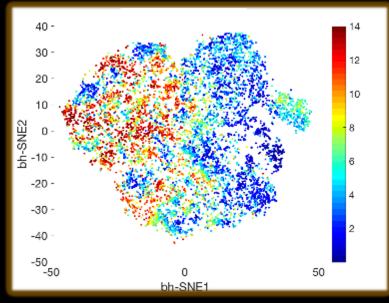

### Higher m score: better-defined functional subsets

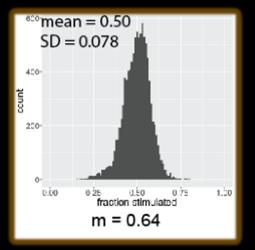

#### Before normalization

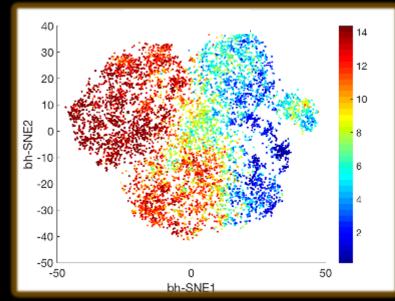

#### IFN $\alpha$ - pSTAT5 –log(q value)

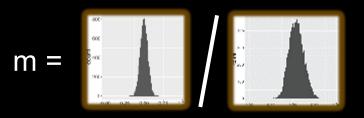

#### After normalization

#### IFN $\alpha$ - pSTAT5 –log(q value)

## Summary 2

- KNN architecture can be used to assess global tubeto-tube technical variation
- Normalization of data brings knn ratios closer to 50%, and does not alter functional information
- Applications: replicate variation, donor-donor variation, optimizing normalization methods...

# Other questions that KNN can be used to answer

- Does one's panel contain any redundant markers?
- How much information do you lose by doing a low dimensional embedding (and which is the best?)

Flow-CAP for low-D embeddings

 What is the Shannon entropy of a CyTOF dataset (quantify heterogeneity, esp for cancer)

### You should try this out yourself!

#### **Bioconductor: Sconify**

## Outline

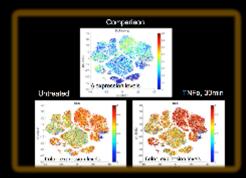

Building per-cell k-nearest neighborhoods in high-D space

Making single-cell comparisons across t-SNE maps

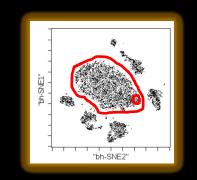

Establishing an evaluation metric for data quality

Evaluating the fidelity of lower-dimensional embeddings

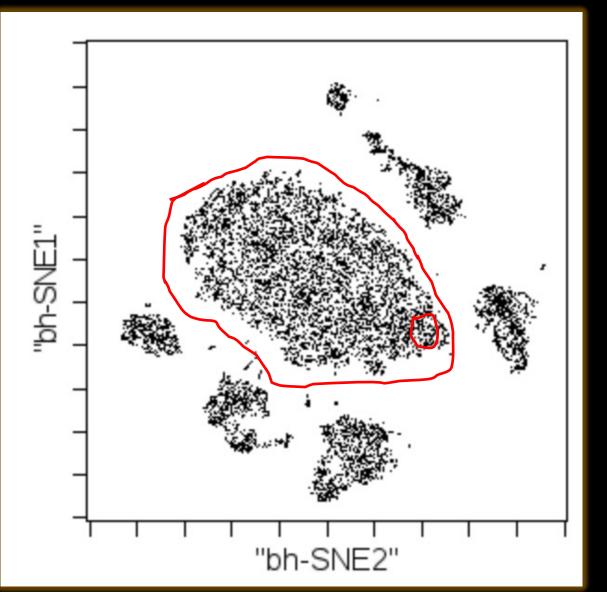

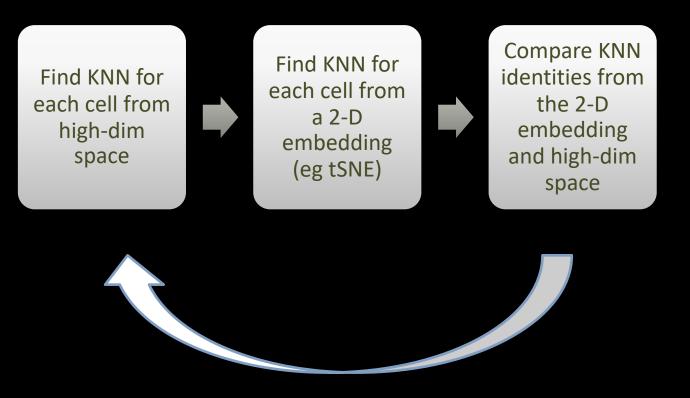

How precise is a t-SNE map? (should we gate/cluster it?)

#### Gate around an Island?

Gate within an Island?

# KNN to determine fidelity of lower dimensional embeddings

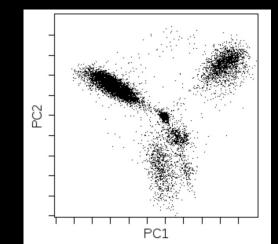

Repeat across a wide range of values for K

# Two low dim embeddings: t-SNE vs PCA

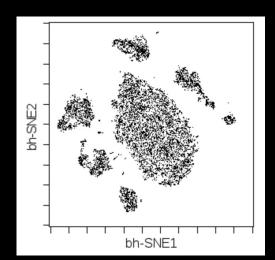

### • PCA

- Seeks to explain the variance of data
- Can only pick up linear structure
- Consistent: same result every time
- Very fast run time

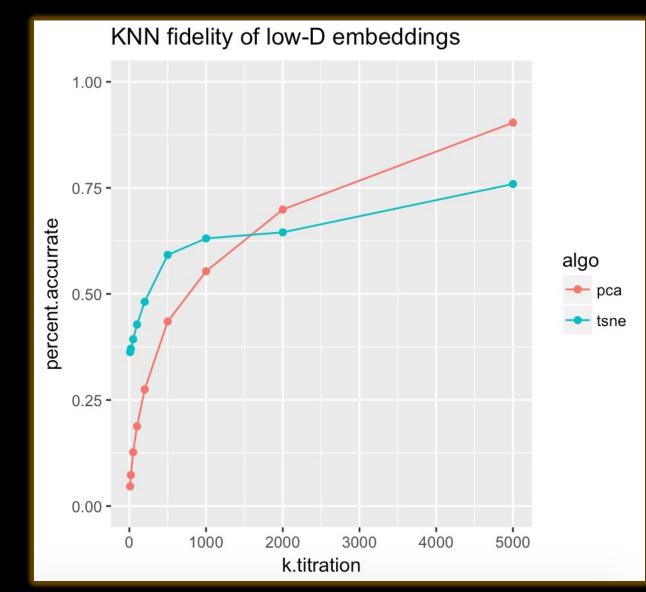

### • t-SNE

- Seeks to preserve local structure
- Can pick up non-linear structure
- Inconsistent: different result every time
- Very slow run time

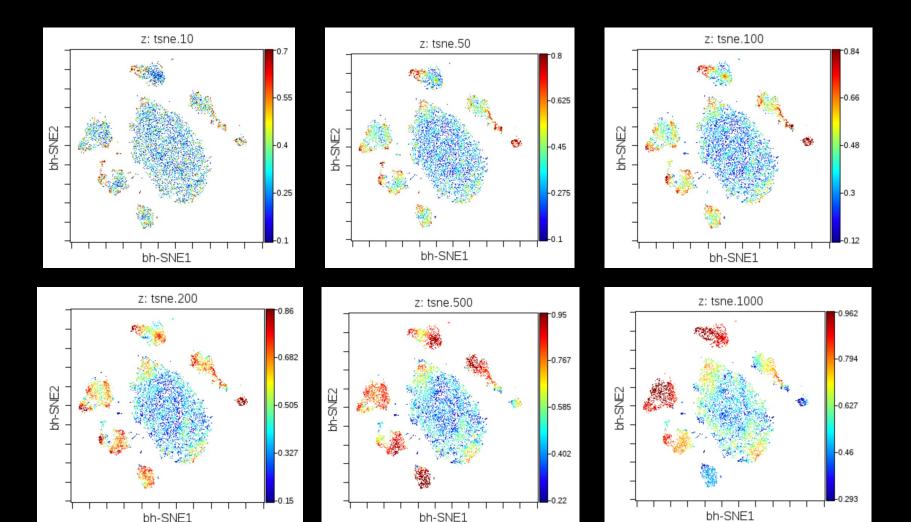

Data from Fragidakis et al Anesthesiology 2015

### Global fidelity of lower dimensional embeddings: tSNE vs PCA

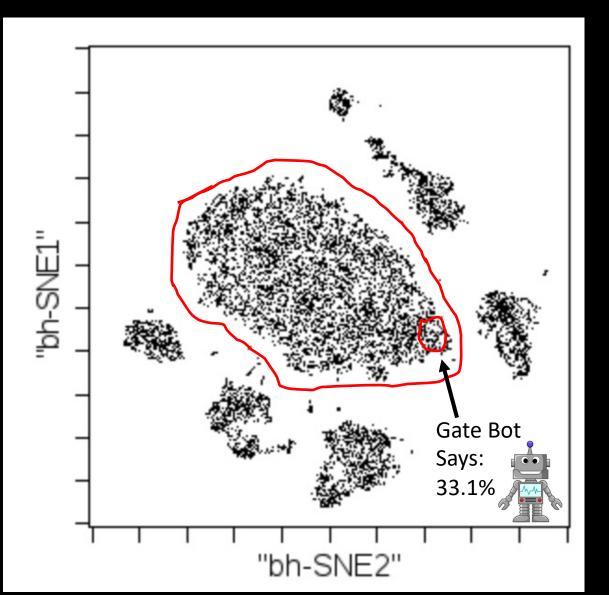

Data: Fragidakis *et al Anesthesiology* 2015 Cells: whole blood Cell number: 10,000

# Fidelity of lower dimensional embeddings is region-specific

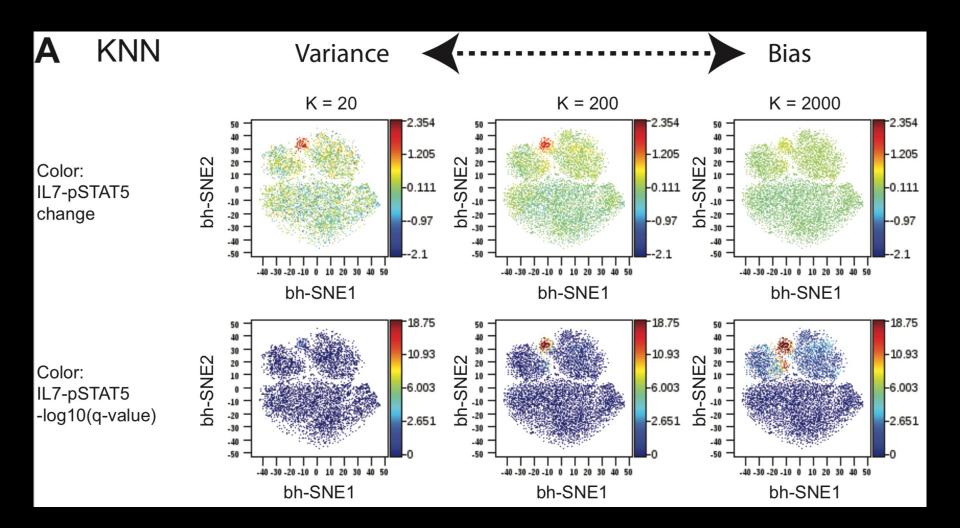

# Future direction: toward a tool for people who want to gate their t-SNE maps

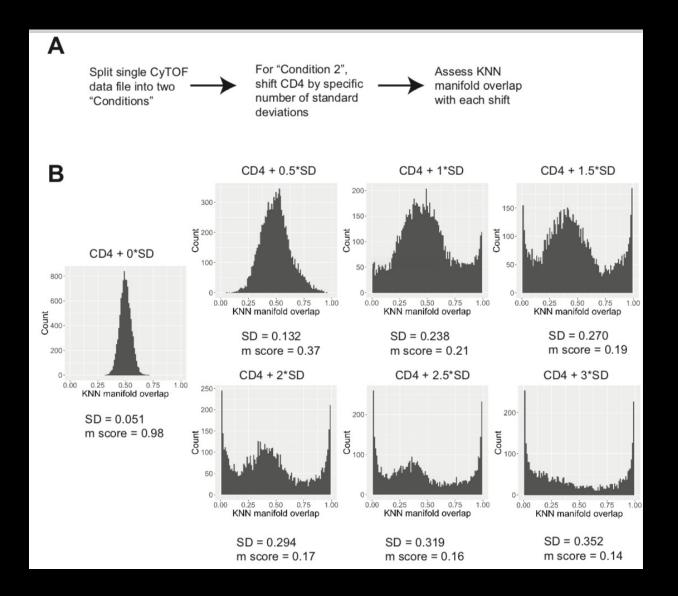

Step 1: draw a gate (or cluster) Step 2: computer outputs % accuracy compared to high-d space

## Visual of choice of K: bias-variance tradeoff

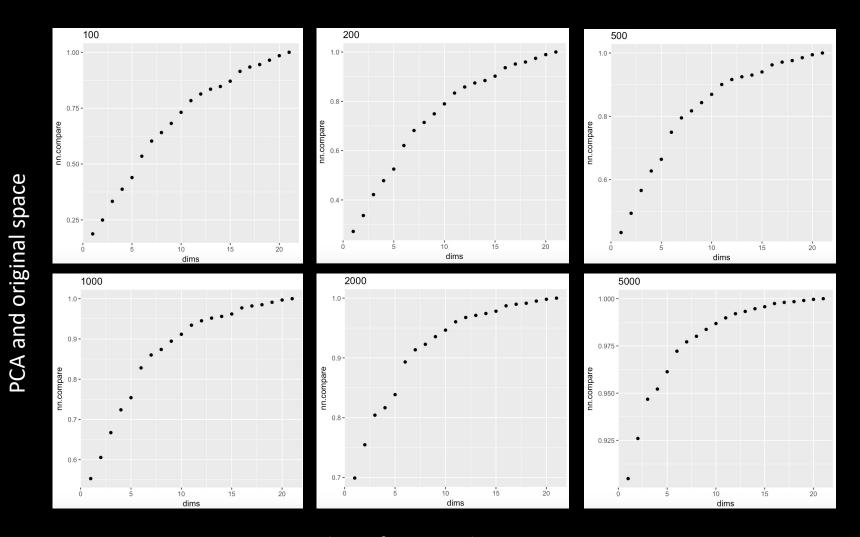

# Synthetically altering data: the sensitivity of KNN

# Where does KNN fit into a data analysis pipeline

- Initial stages of research:
  - Get an understanding of what your dataset has
    - What markers are relevant
    - How dramatic are the "differences"
    - Does the data need to be normalized and scaled
    - Are there regions where sparsity increases (eg that could point to negative selection)
  - Use this information to determine the appropriate scaled-up analysis:
    - How many "clusters" should we expect
    - Where should we expect (and NOT expect) differences

## Information loss contains an elbow point

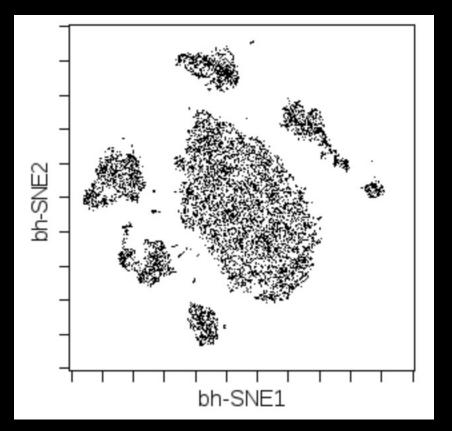

Shared KNN between

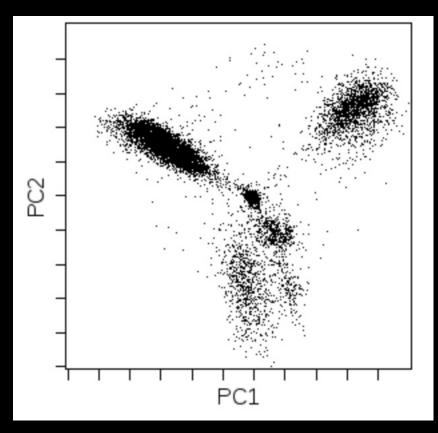

Number of principal components to take KNN from

# What t-SNE and PCA look like

#### t-SNE

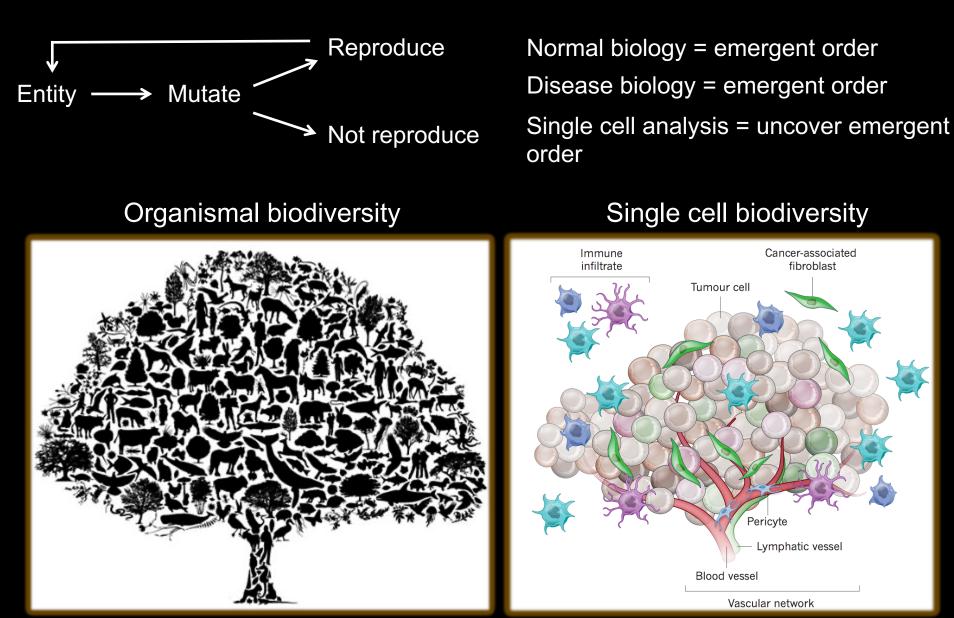

Fragidakis *et al Anesthesiology* 2015 Cells: whole blood Cell number: 10,000

## Single cell analysis: the big picture

# **Questions?**
